Who We Are

2016
Founded in

250+
Members

Team Bath Racing Electric is the University of Bath's Electric Formula Student Team, based out of the Faculty of Engineering and Design. Formula Student is the world's largest student engineering competition, with over 600 universities taking part in its numerous competitions internationally.

Each year the teams are challenged to design, manufacture, test and race a formula-style single-seater racing car. The team comprises of students from all academic years studying engineering, computer science and business among other disciplines.

Sponsor Testimonials

Our partners support TBRe for more than brand exposure - they engage with our students, technology and development throughout the season.

rotork®

"The team's dedication and enthusiasm for the project is infectious."

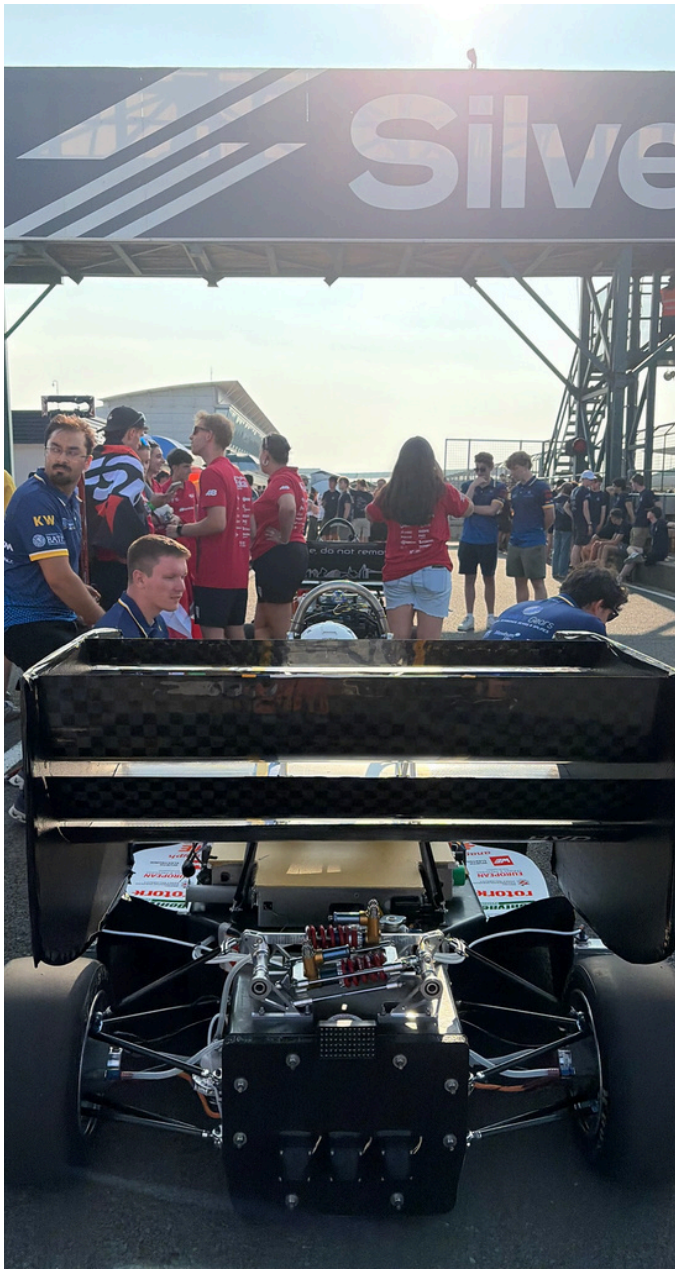

Title Sponsor 2024:
supporting engineering discussions, team events and the TBRe car launch.

Mewburn Ellis

"We were very quickly rewarded by the involvement with such an inspiring group of young people."

Long-standing partner since 2016, supporting TBRe's development and the next generation of engineers.

Our Track Record

→ 2018 - 2021

- 60 members
- Finished all FSUK 2018 events First UK team to attend FS China
- Top UK Electric Formula Student Team
- First UK electric team to compete in Europe
- 2019 Cost & Manufacturing Event Winners
- Multiple successes for AI division

→ 2022 - 2025

- Team grew to 100 members
- Developed driven and driverless EVs
- Introduced first carbon monocoque chassis
- Ranked top UK electric team
- Achieved multiple international podiums
- Won Cost and Manufacturing awards

→ 2026

- Completed the 22 km Endurance
- Proven new in-hub powertrain
- Proven new battery in competition
- Third in FSG MathWorks Award
- First in FSUK MathWorks Award
- Best UK team at Formula Student Germany
- Developed gearboxes in house with Llewellin's Gears

Technical Summary 2027

Power train

The aim is to develop on the previous years in hub solution by moving to 4 wheel drive. To increase available power and reduce mass, we are looking to move to 600V, increasing efficiency. New inverters and 4WD will enable us to deploy more power, improve handling and increase energy efficiency

Chassis

TBRe27 will use our fourth carbon monocoque, with the main focus shifting to significant mass reduction through advanced materials and improved ply stackups. Following TBRe26's strong manufacturing quality and a sub-200 kg car, the chassis target is to reduce mass from around 30 kg to 20 kg. This will be achieved through asymmetric skins, revised core thicknesses and more efficient insert design.

Technical Summary 2027

Aero dynamics

TBRe26 was our most successful aero package, producing 35% more downforce while weighing just 8.5 kg. For TBRe27, we are adapting to the biggest aero regulation change in a decade with a faster, more integrated development process. Closer work with Vehicle Dynamics will help maximise overall car performance.

Electrical

For TBRe27, the electrical team is targeting a 4 kg weight reduction through system consolidation and major repackaging, including a custom PDU and VCU. Development of the custom BMS will continue, with more auxiliary and control functions integrated alongside an expanded telemetry system. In parallel, the team is developing an in-house inverter and other power electronics for future introduction.

Technical Team

Our technical students design, manufacture, test and develop a fully electric race car from the ground up. They work with real budgets, deadlines, suppliers and engineering constraints - gaining experience far beyond a traditional university project.

Our expertise:

- Mechanical Engineering
- Electrical Engineering
- Vehicle Dynamics
- Aerodynamics
- Composites
- Battery & Powertrain

For Our Partners:

- Recruitment
- Technical projects
- Product testing
- Workshops
- Mentoring and brand exposure

Business Team

The Business Team plays a central role in the success of TBRe, managing the commercial, operational and strategic side of the team. From securing partnerships and managing budgets to marketing, events, recruitment and competition strategy, students gain hands-on experience running a high-performance organisation.

Our expertise:

- Sponsorship
- Marketing
- Finance
- Operations
- Events
- Recruitment

Business In Competition:

In competition, our Business Team takes on both the Business Plan Presentation and Cost & Manufacturing events, testing our commercial thinking alongside our understanding of how the car is designed and produced. These events have delivered strong results for TBRe, including multiple Cost & Manufacturing wins and Business Plan finalist finishes in the UK and Europe.

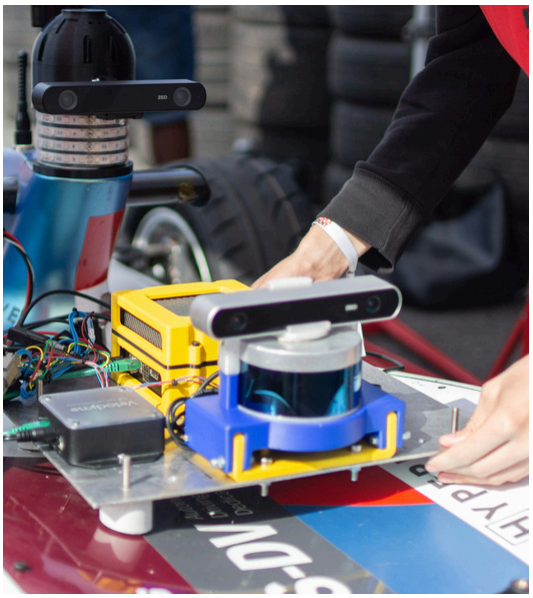

TBRe AI

TBRe AI develops the autonomous systems that allow our team to compete at Formula Student UK and Germany. We work across computer vision, path planning, and control systems to drive the the IMechE's ADS-DV, while also building actuation systems to race the team car at home and internationally.

TBReAI involves students across different degrees, from computer science, AI, natural sciences, and more. Many students come to TBReAI to improve their programming skills, or to explore and develop capcities beyond their core discipline.

Our expertise:

- Perception - Using LiDAR and stereo cameras to map the environment.
- SLAM - Calaculating the environment in relation to the car and knowing it's position.
- Autonomous Control - Path planning and control signal generation to follow the optimal racing line.
- Vehicle Control - Outputting reliable acutation signals to drive the car within its limits.
- Simulation - Developing a virtual environment to test changes off track.
- Actuation systems - Steering and braking the team car

Ai In Competition:

Why Partner With Us?

Access Emerging Talent

Connect directly with ambitious students across engineering, AI, software and business before they enter industry.

Strengthen Your Brand

Gain exposure through our race car, teamwear, competitions, events, social media and university community.

Drive Innovation

Support students working on real engineering, autonomous systems, advanced manufacturing and commercial challenges.

Make Meaningful Engagement

Run workshops, technical talks, recruitment sessions, site visits and collaborative projects with the team.
